Oxidation number denotes theoxidation state of an element in a compound ascertained according to a set of rules formulated on the basis that electron in a covalent bond belongsentirely to more electronegative element.

# Calculation of oxidation number-

- 1. O. S. of all the elements in their elemental form (in standard state) is taken as zero O. S. of elements in Cl<sub>2</sub>, F<sub>2</sub>, O<sub>2</sub>, P<sub>4</sub>, O<sub>3</sub>, Fe(s), H<sub>2</sub>, N<sub>2</sub>, C(graphite) is zero.
- Common O. S. of elements of group one (1<sup>st</sup>) is one. Common O. S. of elements of group two (2<sup>nd</sup>) is two.
- 3. For ions composed of only one atom, theoxidation number is equal to the chargeon the ion.
- The oxidation number of oxygen in most compounds is −2. While in peroxides (e.g., H<sub>2</sub>O<sub>2</sub>, Na<sub>2</sub>O<sub>2</sub>), eachoxygen atom is assigned an oxidationnumber of −1, in superoxides (e.g., KO<sub>2</sub>,RbO<sub>2</sub>) each oxygen atom is assigned anoxidation number of −(<sup>1</sup>/<sub>2</sub>).
- 5. In oxygendifluoride (OF<sub>2</sub>) and dioxygendifluoride (O<sub>2</sub>F<sub>2</sub>), the oxygen is assigned an oxidation number of +2 and +1, respectively.
- 6. The oxidation number of hydrogen is +1 but in metal hydride its oxidation no. is-1.
- 7. In all its compounds, fluorine has an idation number of -1.
- 8. The algebraic sum of the oxidation number of all the atoms in a compound must bezero.
- 9. In polyatomic ion, the algebraic sumof all the oxidation numbers of atoms of the ion must equal the charge on the ion.

**Stocknotation:**the oxidationnumber is expressed by putting a Romannumeral representing the oxidation numberin parenthesis after the symbol of the metal inthe molecular formula. Thus aurous chlorideand auric chloride are written as Au(I)Cl andAu(III)Cl<sub>3</sub>. Similarly, stannous chloride andstannic chloride are written as Sn(II)Cl<sub>2</sub>andSn(IV)Cl<sub>4</sub>.

## **Balancing of redox reactions:**

Oxidation Number Method:

Write the net ionic equation for the reaction of potassium dichromate(VI),  $K_2Cr_2O_7$  with sodium sulphite,Na2SO3, in an acid solution to give chromium(III) ion and the sulphate ion.

**Step 1:** The skeletal ionic equation is:

 $Cr_2O_7^{2-(aq)} + SO_3^{2-(aq)} \rightarrow Cr^{3+}(aq) + SO_4^{2-}(aq)$ Step 2: Assign oxidation numbers for Cr and S +6-2+4-2+3+6-2

 $Cr_2O_7^{2-(aq)} + SO_3^{2-(aq)} \rightarrow Cr^{3+(aq)} + SO_4^{2-(aq)}$ 

**Step 3:** Calculate the increase and decrease of oxidation number, and make them equal:

$$+6-2$$
  $+4-2$   $+3$   $+6$   
 $Cr_2O_7^{2-(aq)} + 3SO_3^{2-}(aq) \rightarrow 2Cr^{3+}(aq) + 3SO_4^{2-}(aq)$ 

**Step 4:** Balance the charge by adding H<sup>+</sup>as the reaction occurs in theacidic medium,

 $Cr_2O_7^{2-}(aq) + 3SO_3^{2-}(aq) 8H^+ \rightarrow 2Cr^{3+}(aq) + 3SO_4^{2-}(aq)$ 

Step 5: Balance the oxygen atom by adding water molecule.  $Cr_2O_7^{2-(aq)} + 3SO_3^{2-}(aq) \quad 8H^+ \rightarrow 2Cr^{3+}(aq) + 3SO_4^{2-}(aq) + 4H_2O(1)$ 

Half Reaction Method

balance the equation showing the oxidation of  $\text{Fe}^{2+}$  ions to  $\text{Fe}^{3+}$  ions by dichromate ions  $(\text{Cr}_2\text{O}_7)^{2-}$  in acidic medium, wherein,  $\text{Cr}_2\text{O}_7^{2-}$  ions are reduced to  $\text{Cr}^{3+}$  ions.

Step 1: Produce unbalanced equation for thereaction in ionic form :

$$Fe^{2+(aq)} + Cr_2O_7^{2-}(aq) \rightarrow Fe^{3+}(aq) + Cr^{3+(aq)}$$

**Step 2:** Separate the equation into halfreactions:

+2 +3Oxidation half : Fe<sup>2+</sup> (aq)  $\rightarrow$  Fe<sup>3+(</sup>aq) +6-2+3 Reduction half :Cr<sub>2</sub>O<sub>7</sub><sup>2-</sup>(aq)  $\rightarrow$  Cr<sup>3+(</sup>aq) **Step 3:** Balance the atoms other than O andH in each half reaction individually.

$$\operatorname{Cr}_2\operatorname{O}_7^{2-}(\operatorname{aq}) \to \operatorname{Cr}^{3+}(\operatorname{aq})$$

Visit www.ncerthelp.com For All NCERT solutions, CBSE sample papers, Question papers, Notes for Class 6 to 12 om

**Step 4:** For reactions occurring in acidicmedium, add H<sub>2</sub>O to balance O atoms and H<sup>+</sup>to balance H atoms.Cr<sub>2</sub>O<sub>7</sub><sup>2-</sup> (aq) +14 H<sup>+</sup> $\rightarrow$  Cr<sup>3+(</sup>aq) + 7H<sup>2</sup>O (1) **Step 5:** Add electrons to one side of the halfreaction to balance the charges. If need be,make the number of electrons equal in the twohalf reactions by multiplying one or both halfreactions by appropriate coefficients. Fe<sup>2+</sup> (aq)  $\rightarrow$  Fe<sup>3+</sup> (aq) + e– Cr<sub>2</sub>O<sub>7</sub><sup>2-</sup> (aq) + 14H<sup>+</sup> (aq) + 6e–  $\rightarrow$  2Cr<sup>3+(</sup>aq) +7H<sub>2</sub>O (1) 6Fe<sup>2+</sup> (aq)  $\rightarrow$ 6 Fe<sup>3+</sup> (aq) +6 e– **Step 6:** We add the two half reactions toachieve the overall reaction and cancel theelectrons on each side. This gives the net ionicequation as : 6Fe<sup>2+(</sup>aq) + Cr<sub>2</sub>O<sub>7</sub><sup>2-(</sup>aq) + 14H<sup>+(</sup>aq)  $\rightarrow$  6 Fe<sup>3+(</sup>aq) +2Cr<sup>3+(</sup>aq) + 7H<sub>2</sub>O(1) A **redox couple** is defined as havingtogether the oxidised and reduced forms of asubstance taking part in an oxidation orreduction half reaction. Represented as Zn<sup>2+/</sup>Zn and Cu<sup>2+</sup>/Cu.

Electrochemical cells are the devices which are used to get electric current by using chemical reaction.

The potential associated with eachelectrode is known as **electrode potential**. If the concentration of each species taking part in the electrode reaction is unity (if any gasappears in the electrode reaction, it is confined to 1 atmospheric pressure) and further thereaction is carried out at 298K, then the potential of each electrode is said to be the **Standard Electrode Potential**.

• SHE is used to measure electrode potential and its standard electrode potential is taken as 0.00 V.
