Question 1:

-:11	:	+6~	h		۰.
	111	the	1)	เสท	ĸς

- (i) The centre of a circle lies in of the circle. (exterior/ interior)
- (ii) A point, whose distance from the centre of a circle is greater than its radius lies
- in ______ of the circle. (exterior/ interior)
- (iii) The longest chord of a circle is a ______ of the circle.(iv) An arc is a when its ends are the ends of a diameter.
- when its ends are the ends of a diameter.
- (\mathbf{v}) Segment of a circle is the region between an arc and _____ of the circle.

(vi) A circle divides the plane, on which it lies, in _____ parts.

Answer:

- (i) The centre of a circle lies in interior of the circle.
- (ii) A point, whose distance from the centre of a circle is greater than its radius lies
- in <u>exterior</u> of the circle.
- (iii) The longest chord of a circle is a <u>diameter</u> of the circle.
- (iv) An arc is a <u>semi-circle</u> when its ends are the ends of a diameter.

(v) Segment of a circle is the region between an arc and chord of the circle.

(vi) A circle divides the plane, on which it lies, in three parts.

Question 2:

Write True or False: Give reasons for your answers.

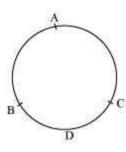

- (i) Line segment joining the centre to any point on the circle is a radius of the circle.
- (ii) A circle has only finite number of equal chords.
- (iii) If a circle is divided into three equal arcs, each is a major arc.
- (iv) A chord of a circle, which is twice as long as its radius, is a diameter of the circle.
- (v) Sector is the region between the chord and its corresponding arc.
- (vi) A circle is a plane figure.

Answer:

(i) True. All the points on the circle are at equal distances from the centre of the circle, and this equal distance is called as radius of the circle.

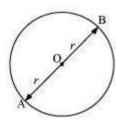

(ii) False. There are infinite points on a circle. Therefore, we can draw infinite number of chords of given length. Hence, a circle has infinite number of equal chords.

(iii) False. Consider three arcs of same length as AB, BC, and CA. It can be observed that for minor arc BDC, CAB is a major arc. Therefore, AB, BC, and CA are minor arcs of the circle.

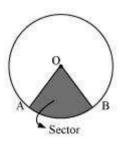

(iv) True. Let AB be a chord which is twice as long as its radius. It can be observed that in this situation, our chord will be passing through the centre of the circle.

Therefore, it will be the diameter of the circle.

(v) False. Sector is the region between an arc and two radii joining the centre to the end points of the arc. For example, in the given figure, OAB is the sector of the circle.

(vi) True. A circle is a two-dimensional figure and it can also be referred to as a plane figure.

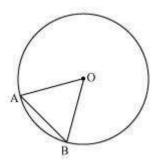

Ouestion 1:

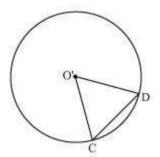

Recall that two circles are congruent if they have the same radii. Prove that equal chords of congruent circles subtend equal angles at their centres.

Answer:

A circle is a collection of points which are equidistant from a fixed point. This fixed point is called as the centre of the circle and this equal distance is called as radius of the circle. And thus, the shape of a circle depends on its radius. Therefore, it can be observed that if we try to superimpose two circles of equal radius, then both circles will cover each other. Therefore, two circles are congruent if they have equal radius.

Consider two congruent circles having centre O and O' and two chords AB and CD of equal lengths.

In $\triangle AOB$ and $\triangle CO'D$,

AB = CD (Chords of same length)

OA = O'C (Radii of congruent circles)

OB = O'D (Radii of congruent circles)

 \therefore $\triangle AOB \cong \triangle CO'D$ (SSS congruence rule)

 $\Rightarrow \angle AOB = \angle CO'D$ (By CPCT)

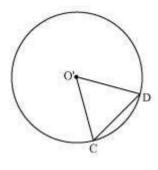

Hence, equal chords of congruent circles subtend equal angles at their centres.

Question 2:

Prove that if chords of congruent circles subtend equal angles at their centres, then the chords are equal.

Let us consider two congruent circles (circles of same radius) with centres as O and 0'.

In $\triangle AOB$ and $\triangle CO'D$,

 $\angle AOB = \angle CO'D$ (Given)

OA = O'C (Radii of congruent circles)

OB = O'D (Radii of congruent circles)

 \therefore $\triangle AOB \cong \triangle CO'D$ (SSS congruence rule)

 \Rightarrow AB = CD (By CPCT)

Hence, if chords of congruent circles subtend equal angles at their centres, then the chords are equal.

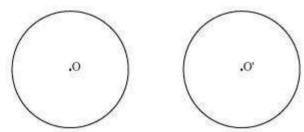

Question 1:

Draw different pairs of circles. How many points does each pair have in common?

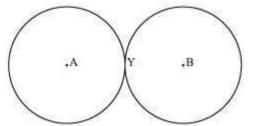

What is the maximum number of common points?

Answer:

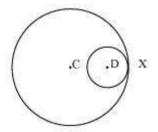

Consider the following pair of circles.

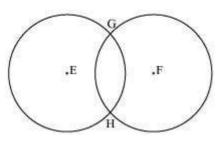

The above circles do not intersect each other at any point. Therefore, they do not have any point in common.

The above circles touch each other only at one point Y. Therefore, there is 1 point in common.

The above circles touch each other at 1 point X only. Therefore, the circles have 1 point in common.

These circles intersect each other at two points G and H. Therefore, the circles have two points in common. It can be observed that there can be a maximum of 2 points in common. Consider the situation in which two congruent circles are superimposed on each other. This situation can be referred to as if we are drawing the circle two times.

Question 2:

Suppose you are given a circle. Give a construction to find its centre.

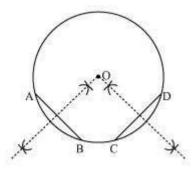

Answer:

The below given steps will be followed to find the centre of the given circle.

Step1. Take the given circle.

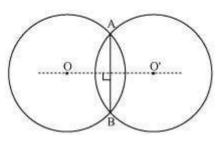

Step2. Take any two different chords AB and CD of this circle and draw perpendicular bisectors of these chords.

Step3. Let these perpendicular bisectors meet at point O. Hence, O is the centre of the given circle.

Question 3:

If two circles intersect at two points, then prove that their centres lie on the perpendicular bisector of the common chord.

Consider two circles centered at point O and O', intersecting each other at point A and B respectively.

Join AB. AB is the chord of the circle centered at O. Therefore, perpendicular bisector

of AB will pass through O. Again, AB is also the chord of the circle centered at O'. Therefore, perpendicular

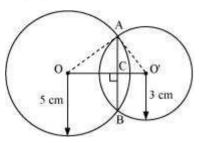

bisector of AB will also pass through O'. Clearly, the centres of these circles lie on the perpendicular bisector of the common

chord.

Question 1:

Two circles of radii 5 cm and 3 cm intersect at two points and the distance between their centres is 4 cm. Find the length of the common chord.

Answer:

Let the radius of the circle centered at O and O' be $5\ \mathrm{cm}$ and $3\ \mathrm{cm}$ respectively.

$$OA = OB = 5 cm$$

$$O'A = O'B = 3 cm$$

OO' will be the perpendicular bisector of chord AB.

$$\therefore$$
 AC = CB

In ΔOAC,

It is given that, OO' = 4 cm

Let OC be x. Therefore, O'C will be 4 - x.

$OA^2 = AC^2 + OC^2$

$$\Rightarrow 5^2 = AC^2 + x^2$$

$$\Rightarrow 25 - x^2 = AC^2 \dots (1)$$

$$O'A^2 = AC^2 + O'C^2$$

$$\Rightarrow 3^2 = AC^2 + (4 - x)^2$$

$$\Rightarrow 9 = AC^2 + 16 + x^2 - 8x$$

$$\Rightarrow AC^2 = -x^2 - 7 + 8x \dots (2)$$

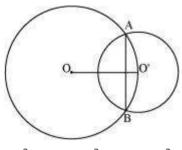

From equations (1) and (2), we obtain

$$25 - x^2 = -x^2 - 7 + 8x$$

$$8x = 32$$

Therefore, the common chord will pass through the centre of the smaller circle i.e.,

O' and hence, it will be the diameter of the smaller circle.

 $AC^2 = 25 - x^2 = 25 - 4^2 = 25 - 16 = 9$ $\therefore AC = 3 \text{ m}$

x = 4

Length of the common chord AB = $2 \text{ AC} = (2 \times 3) \text{ m} = 6 \text{ m}$

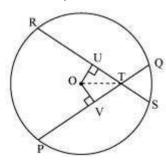

Question 2:

other at point T.

If two equal chords of a circle intersect within the circle, prove that the segments of

Answer: Let PQ and RS be two equal chords of a given circle and they are intersecting each

one chord are equal to corresponding segments of the other chord.

Draw perpendiculars OV and OU on these chords.

In \triangle OVT and \triangle OUT,

OV = OU (Equal chords of a circle are equidistant from the centre)

 $\angle OVT = \angle OUT \text{ (Each 90°)}$

OT = OT (Common)

∴ \triangle OVT \cong \triangle OUT (RHS congruence rule)

∴ VT = UT (By CPCT) ... (1)

It is given that,

PQ = RS ... (2)

$$\frac{1}{2}PQ = \frac{1}{2}RS$$

 \Rightarrow PV = RU ... (3)

On adding equations (1) and (3), we obtain

PV + VT = RU + UT

 \Rightarrow PT = RT ... (4)

On subtracting equation (4) from equation (2), we obtain

⇒ QT = ST ... (5)

PQ - PT = RS - RT

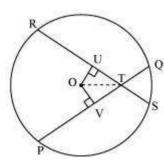

Equations (4) and (5) indicate that the corresponding segments of chords PQ and RS

are congruent to each other.

Ouestion 3:

If two equal chords of a circle intersect within the circle, prove that the line joining the point of intersection to the centre makes equal angles with the chords.

Answer:

Let PQ and RS are two equal chords of a given circle and they are intersecting each other at point T.

Draw perpendiculars OV and OU on these chords.

In $\triangle OVT$ and $\triangle OUT$,

OV = OU (Equal chords of a circle are equidistant from the centre)

OT = OT (Common)

∴ \triangle OVT \cong \triangle OUT (RHS congruence rule)

 \therefore \square OTV = \square OTU (By CPCT)

 $\angle OVT = \angle OUT (Each 90^{\circ})$

Therefore, it is proved that the line joining the point of intersection to the centre makes equal angles with the chords.

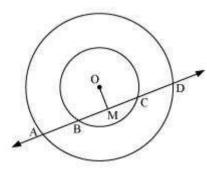

Question 4:

If a line intersects two concentric circles (circles with the same centre) with centre O at A, B, C and D, prove that AB = CD (see figure 10.25).

Answer:

Let us draw a perpendicular OM on line AD.

It can be observed that BC is the chord of the smaller circle and AD is the chord of the bigger circle.

We know that perpendicular drawn from the centre of the circle bisects the chord.

 \square BM = MC ... (1)

And, $AM = MD \dots (2)$

On subtracting equation (2) from (1), we obtain

AM - BM = MD - MC

 \square AB = CD

Question 5:

Three girls Reshma, Salma and Mandip are playing a game by standing on a circle of radius 5 m drawn in a park. Reshma throws a ball to Salma, Salma to Mandip, Mandip to Reshma. If the distance between Reshma and Salma and between Salma and Mandip is 6 m each, what is the distance between Reshma and Mandip?

Answer:

Draw perpendiculars OA and OB on RS and SM respectively.

$$AR = AS = \frac{6}{2} = 3 \,\mathrm{m}$$

$$OR = OS = OM = 5 \text{ m.}$$
 (Radii of the circle)

$$OA^2 + AR^2 = OR^2$$

$$OA^2 + (3 \text{ m})^2 = (5 \text{ m})^2$$

$$OA^2 = (25 - 9) \text{ m}^2 = 16 \text{ m}^2$$

$$OA = 4 m$$

In ΔOAR,

ORSM will be a kite (OR = OM and RS = SM). We know that the diagonals of a kite are perpendicular and the diagonal common to both the isosceles triangles is bisected by another diagonal.

 \square RCS will be of 90° and RC = CM

Area of $\triangle ORS = \frac{1}{2} \times OA \times RS$

 $\frac{1}{2} \times RC \times OS = \frac{1}{2} \times 4 \times 6$

 $RC \times 5 = 24$

RC = 4.8

RM = 2RC = 2(4.8) = 9.6

Therefore, the distance between Reshma and Mandip is 9.6 m.

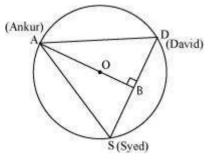

hands to talk each other. Find the length of the string of each phone.

Question 6:

A circular park of radius 20 m is situated in a colony. Three boys Ankur, Syed and

David are sitting at equal distance on its boundary each having a toy telephone in his

Answer:

It is given that AS = SD = DA

Therefore, \triangle ASD is an equilateral triangle.

OA (radius) = 20 m

Medians of equilateral triangle pass through the circum centre (O) of the equilateral

triangle ASD. We also know that medians intersect each other in the ratio 2: 1. As

AB is the median of equilateral triangle ASD, we can write

$$\Rightarrow OB = \left(\frac{20}{2}\right) m = 10 m$$

$$\Box AB = OA + OB = (20 + 10) m = 30 m$$
 In $\triangle ABD$,

In
$$\triangle ABD$$
,
 $AD^2 = AB^2 + BD^2$

$$AD^2 = (30)^2 + \left(\frac{AD}{2}\right)^2$$

$$D^2 = (3$$

 $\Rightarrow \frac{OA}{OB} = \frac{2}{1}$

 $\Rightarrow \frac{20 \text{ m}}{\text{OB}} = \frac{2}{1}$

$$\frac{3}{4}AD^2 = 900$$

$$D^2 = 9$$

$$AD^2 = 90$$
$$D^2 = 1200$$

$$AD^2 = 1200$$

$$AD^2 = 1200$$
$$AD = 20\sqrt{3}$$

$$AD=20\sqrt{3}$$
 Therefore, the length of the string of each phone will be $20\sqrt{3}$ m.

$$=20\sqrt{3}$$

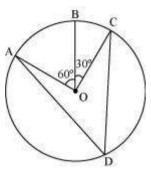

$$^{2} = 900$$

$$AD^2 = 900 + \frac{1}{4}AD^2$$

Ouestion 1:

find \square ADC.

In the given figure, A, B and C are three points on a circle with centre O such that $\square BOC = 30^{\circ}$ and $\square AOB = 60^{\circ}$. If D is a point on the circle other than the arc ABC,

Answer:

It can be observed that

$$\square AOC = \square AOB + \square BOC$$

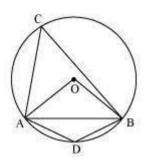

$$= 60^{\circ} + 30^{\circ}$$

We know that angle subtended by an arc at the centre is double the angle subtended by it any point on the remaining part of the circle.

$$\angle ADC = \frac{1}{2} \angle AOC = \frac{1}{2} \times 90^{\circ} = 45^{\circ}$$

Question 2:

A chord of a circle is equal to the radius of the circle. Find the angle subtended by the chord at a point on the minor arc and also at a point on the major arc.

In ΔOAB,

$$AB = OA = OB = radius$$

□ □ AOB = 60°

$$\square$$
 \triangle OAB is an equilateral triangle.

Therefore, each interior angle of this triangle will be of 60°.

$$\angle ACB = \frac{1}{2} \angle AOB = \frac{1}{2} (60^{\circ}) = 30^{\circ}$$

In cyclic quadrilateral ACBD,

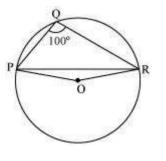

$$\square$$
ACB + \square ADB = 180° (Opposite angle in cyclic quadrilateral)

 \Box \Box ADB = 180° - 30° = 150°

Therefore, angle subtended by this chord at a point on the major arc and the minor arc are 30° and 150° respectively.

Question 3:

In the given figure, $\Box PQR = 100^{\circ}$, where P, Q and R are points on a circle with centre O. Find □OPR.

Consider PR as a chord of the circle.

Take any point S on the major arc of the circle.

PQRS is a cyclic quadrilateral.

 \Box POR + \Box PSR = 180° (Opposite angles of a cyclic quadrilateral)

 \Box \Box PSR = 180° - 100° = 80°

We know that the angle subtended by an arc at the centre is double the angle

subtended by it at any point on the remaining part of the circle.

 \square POR = $2\square$ PSR = 2 (80°) = 160°

In ΔPOR,

OP = OR (Radii of the same circle)

 \square \square OPR = \square ORP (Angles opposite to equal sides of a triangle)

 \Box OPR + \Box ORP + \Box POR = 180° (Angle sum property of a triangle)

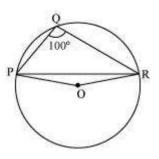

2 □OPR + 160° = 180°

 $2 \square OPR = 180^{\circ} - 160^{\circ} = 20^{\circ}$

□OPR = 10°

Question 3:

In the given figure, $\Box PQR = 100^{\circ}$, where P, Q and R are points on a circle with centre O. Find $\Box OPR$.

Consider PR as a chord of the circle.

Take any point S on the major arc of the circle.

PQRS is a cyclic quadrilateral.

 \square PQR + \square PSR = 180° (Opposite angles of a cyclic quadrilateral) \square \square PSR = 180° - 100° = 80°

We know that the angle subtended by an arc at the centre is double the angle

subtended by it at any point on the remaining part of the circle.

 \square \square POR = $2\square$ PSR = 2 (80°) = 160°

OP = OR (Radii of the same circle)

 \square \square OPR = \square ORP (Angles opposite to equal sides of a triangle)

 \Box OPR + \Box ORP + \Box POR = 180° (Angle sum property of a triangle)

 $2 \square OPR + 160^{\circ} = 180^{\circ}$

 $2 \square OPR = 180^{\circ} - 160^{\circ} = 20^{\circ}$

 \Box OPR = 10°

In ΔPOR,

Question 5:

In the given figure, A, B, C and D are four points on a circle. AC and BD intersect at a point E such that \Box BEC = 130° and \Box ECD = 20°. Find \Box BAC.

Answer: In $\triangle CDE$,

 \Box CDE + \Box DCE = \Box CEB (Exterior angle)

 \square \square CDE + 20° = 130°

However, \Box BAC = \Box CDE (Angles in the same segment of a circle)

□ □BAC = 110°

Question 6:

□ □CDE = 110°

ABCD is a cyclic quadrilateral whose diagonals intersect at a point E. If $\Box DBC = 70^{\circ}$,

 \square BAC is 30°, find \square BCD. Further, if AB = BC, find \square ECD.

Answer:

Fau aband CD

For chord CD, \Box CBD = \Box CAD (Angles in the same segment)

 $\Box CAD = 70^{\circ}$

 $\square BAD = \square BAC + \square CAD = 30^{\circ} + 70^{\circ} = 100^{\circ}$

 \Box BCD + \Box BAD = 180° (Opposite angles of a cyclic quadrilateral)

In ΔABC,
AB = BC (Given)
$\Box \Box BCA = \Box CAB$ (Angles onnosite to

es opposite to equal sides of a triangle) \square \square BCA = 30°

We have, \Box BCD = 80° \square \square BCA + \square ACD = 80°

 \Box BCD + 100° = 180°

 \Box BCD = 80°

 $30^{\circ} + \Box ACD = 80^{\circ}$

 \square \square ACD = 50°

 \Box \Box ECD = 50°

Question 7:

If diagonals of a cyclic quadrilateral are diameters of the circle through the vertices of the quadrilateral, prove that it is a rectangle.

Let ABCD be a cyclic quadrilateral having diagonals BD and AC, intersecting each

other at point O.

$$\angle BAD = \frac{1}{2} \angle BOD = \frac{180^{\circ}}{2} = 90^{\circ}$$
(Consider BD as a cho

(Consider BD as a chord)

 \square BCD + \square BAD = 180° (Cyclic quadrilateral)

 \Box BCD = 180° - 90° = 90°

 $\angle ADC = \frac{1}{2} \angle AOC = \frac{1}{2} (180^{\circ}) = 90^{\circ}$ (Considering AC as a chord)

 \Box ADC + \Box ABC = 180° (Cyclic quadrilateral)

90°	+	\Box ABC	=	180°

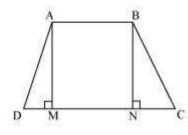

$$\Box$$
ABC = 90°

Each interior angle of a cyclic quadrilateral is of 90°. Hence, it is a rectangle.

Question 8:

If the non-parallel sides of a trapezium are equal, prove that it is cyclic.

Answer:

Consider a trapezium ABCD with AB \mid |CD and BC = AD.

Draw AM \square CD and BN \square CD.

In \triangle AMD and \triangle BNC,

AD = BC (Given)

 \square AMD = \square BNC (By construction, each is 90°)

AM = BM (Perpendicular distance between two parallel lines is same)

 \square \triangle AMD \square \triangle BNC (RHS congruence rule)

 \square \square ADC = \square BCD (CPCT) ... (1)

 \square BAD and \square ADC are on the same side of transversal AD.

 $\square BAD + \square ADC = 180^{\circ} \dots (2)$

 \square BAD + \square BCD = 180° [Using equation (1)]

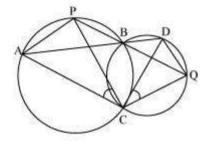

This equation shows that the opposite angles are supplementary.

Therefore, ABCD is a cyclic quadrilateral.

Question 9:

Two circles intersect at two points B and C. Through B, two line segments ABD and PBQ are drawn to intersect the circles at A, D and P, Q respectively (see the given figure). Prove that $\Box ACP = \Box QCD$.

Join chords AP and DQ.

For chord AP,

 \Box PBA = \Box ACP (Angles in the same segment) ... (1)

For chord DQ,

 $\square DBQ = \square QCD$ (Angles in the same segment) ... (2)

ABD and PBQ are line segments intersecting at B.

 \square PBA = \square DBQ (Vertically opposite angles) ... (3)

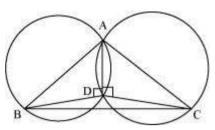

From equations (1), (2), and (3), we obtain

Trom equations (1), (2), and (5), we obtain

 $\Box ACP = \Box QCD$

Question 10:

If circles are drawn taking two sides of a triangle as diameters, prove that the point of intersection of these circles lie on the third side.

Consider a AABC.

Two circles are drawn while taking AB and AC as the diameter.

Let they intersect each other at D and let D not lie on BC.

Join AD.

 \Box ADB = 90° (Angle subtended by semi-circle)

 \square ADC = 90° (Angle subtended by semi-circle)

 \Box BDC = \Box ADB + \Box ADC = 90° + 90° = 180°

Therefore, BDC is a straight line and hence, our assumption was wrong.

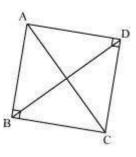

Thus, Point D lies on third side BC of \triangle ABC.

Question 11:

ABC and ADC are two right triangles with common hypotenuse AC. Prove that $\Box CAD$

 $= \Box CBD.$ Answer:

In ΔABC,

 \Box ABC + \Box BCA + \Box CAB = 180° (Angle sum property of a triangle)

 \square 90° + \square BCA + \square CAB = 180°

 \square \square BCA + \square CAB = 90° ... (1)

In ΔADC, \Box CDA + \Box ACD + \Box DAC = 180° (Angle sum property of a triangle)

 \square 90° + \square ACD + \square DAC = 180°

 \square \square ACD + \square DAC = 90° ... (2)

Adding equations (1) and (2), we obtain \Box BCA + \Box CAB + \Box ACD + \Box DAC = 180°

 \Box (\Box BCA + \Box ACD) + (\Box CAB + \Box DAC) = 180°

 \Box BCD + \Box DAB = 180° ... (3)

opposite angles of quadrilateral ABCD is 180°. Therefore, it is a cyclic quadrilateral.

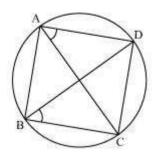

However, it is given that

 $\Box B + \Box D = 90^{\circ} + 90^{\circ} = 180^{\circ} \dots (4)$

From equations (3) and (4), it can be observed that the sum of the measures of

Consider chord CD.

 \Box CAD = \Box CBD (Angles in the same segment)

Question 12:

Prove that a cyclic parallelogram is a rectangle.

Answer:

Let ABCD be a cyclic parallelogram.

 $\Box A + \Box C = 180^{\circ}$ (Opposite angles of a cyclic quadrilateral) ... (1)

We know that opposite angles of a parallelogram are equal.

 $\Box \Box A = \Box C \text{ and } \Box B = \Box D$

From equation (1),

 $\Box A + \Box C = 180^{\circ}$

 \Box \Box A + \Box A = 180°

□ 2 □A = 180°

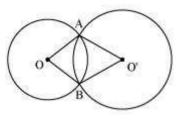

□ □A = 90°

Parallelogram ABCD has one of its interior angles as 90° . Therefore, it is a rectangle.

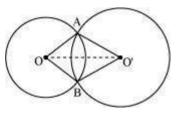

Ouestion 1:

Prove that line of centres of two intersecting circles subtends equal angles at the two points of intersection.

Answer:

Let two circles having their centres as O and O' intersect each other at point A and B respectively. Let us join O'.

In $\triangle AO^{O'}$ and $BO^{O'}$,

OA = OB (Radius of circle 1)

O'A = O'B (Radius of circle 2)

 $O^{O'} = O^{O'}$ (Common)

 $\Delta AO^{O'} \square \Delta BO^{O'}$ (By SSS congruence rule)

 $\Box OA^{O'} = \Box OB^{O'}$ (By CPCT)

Therefore, line of centres of two intersecting circles subtends equal angles at the two points of intersection.

Question 2:

Two chords AB and CD of lengths 5 cm 11cm respectively of a circle are parallel to each other and are on opposite sides of its centre. If the distance between AB and CD is 6 cm, find the radius of the circle.

Draw OM □ AB and ON □ CD. Join OB and OD.

Answer:

 $ND = \frac{CD}{2} = \frac{11}{2}$

 $OM^2 + MB^2 = OB^2$

$$BM = \frac{AB}{2} = \frac{5}{2}$$
 (Perpendicular from the centre bisects the chord)

Let ON be x. Therefore, OM will be 6-x.

In ΔMOB,

$$\left(6-x\right)^2 + \left(\frac{5}{2}\right)^2 = OB^2$$

$$36 + x^2 - 12x + \frac{25}{4} = OB^2 \qquad \dots (1)$$

In ΔNOD, $ON^2 + ND^2 = OD^2$

$$x^{2} + \left(\frac{11}{2}\right)^{2} = OD^{2}$$

 $x^{2} + \frac{121}{4} = OD^{2}$... (2)

We have OB = OD (Radii of the same circle)

Therefore, from equation (1) and (2),

 $36 + x^2 - 12x + \frac{25}{4} = x^2 + \frac{121}{4}$

 $=\frac{144+25-121}{4} = \frac{48}{4} = 12$

Therefore, the radius of the circle is ²

 $12x = 36 + \frac{25}{4} - \frac{121}{4}$

From equation (2),

 $(1)^2 + (\frac{121}{4}) = OD^2$

 $OD^2 = 1 + \frac{121}{4} = \frac{125}{4}$

 $OD = \frac{5}{2}\sqrt{5}$

Question 3:

centre?

x = 1

The lengths of two parallel chords of a circle are 6 cm and 8 cm. If the smaller chord is at distance 4 cm from the centre, what is the distance of the other chord from the

Let AB and CD be two parallel chords in a circle centered at O. Join OB and OD.

Distance of smaller chord AB from the centre of the circle = 4 cm

$$OM = 4 \text{ cm}$$

$$\frac{AB}{2} = \frac{6}{2} = 3 \text{ cm}$$

ON=3 Therefore, the distance of the bigger chord from the centre is 3 cm. Question 4:

(Radii of the same circle)

Let the vertex of an angle ABC be located outside a circle and let the sides of the angle intersect equal chords AD and CE with the circle. Prove that □ABC is equal to

In ΔOMB,

 $OM^2 + MB^2 = OB^2$

 $(4)^2 + (3)^2 = OB^2$

 $16 + 9 = OB^2$

 $OB = \sqrt{25}$ OB = 5 cm

In ΔOND,

OD = OB = 5 cm

 $ND = \frac{CD}{2} = \frac{8}{2} = 4cm$

 $ON^2 + ND^2 = OD^2$

 $ON^2 + (4)^2 = (5)^2$

 $ON^2 = 25 - 16 = 9$

half the difference of the angles subtended by the chords AC and DE at the centre.

Answer:

In ΔAOD and ΔCOE,

OA = OC (Radii of the same circle)
OD = OE (Radii of the same circle)

\square \triangle AOD \square \triangle COE (SSS congruence rule)	
\Box OAD = \Box OCE (By CPCT) (1)	
\Box ODA = \Box OEC (By CPCT) (2)	
Also,	
\Box OAD = \Box ODA (As OA = OD) (3)	
From equations (1), (2), and (3), we obtain	
$\Box OAD = \Box OCE = \Box ODA = \Box OEC$	
Let $\Box OAD = \Box OCE = \Box ODA = \Box OEC = x$	
In Δ OAC,	htt
OA = OC	Ö
\square \square OCA = \square OAC (Let a)	http://www.ncerthelp.com
In Δ ODE,	\geq
OD = OE	\geq
$\Box OED = \Box ODE (Let y)$	D
ADEC is a cyclic quadrilateral.	Ce
\square CAD + \square DEC = 180° (Opposite angles are supplementary)	7
$x + a + x + y = 180^{\circ}$	<u>10</u>
$2x + a + y = 180^{\circ}$	0
$y = 180^{\circ} - 2x - a \dots (4)$	CC
However, $\Box DOE = 180^{\circ} - 2y$	B
And, $\square AOC = 180^{\circ} - 2a$	
$\Box DOE - \Box AOC = 2a - 2y = 2a - 2 (180^{\circ} - 2x - a)$	
$= 4a + 4x - 360^{\circ} \dots (5)$	
\square BAC + \square CAD = 180° (Linear pair)	
$\square \ \square BAC = 180^{\circ} - \square CAD = 180^{\circ} - (a + x)$	
Similarly, $\Box ACB = 180^{\circ} - (a + x)$	
In ΔABC,	
\square ABC + \square BAC + \square ACB = 180° (Angle sum property of a triangle)	
$\Box ABC = 180^{\circ} - \Box BAC - \Box ACB$	

AD = CE (Given)

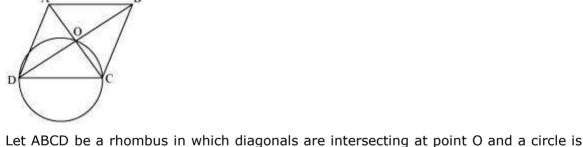

$$= \frac{1}{2} [4a + 4x - 360^{\circ}]$$

 $= 180^{\circ} - (180^{\circ} - a - x) - (180^{\circ} - a - x)$

$$\Box ABC = \frac{1}{2} [\Box DOE - \Box AOC] [Using equation (5)]$$

Ouestion 5:

the point of intersection of its diagonals. Answer:

 $= 2a + 2x - 180^{\circ}$

drawn while taking side CD as its diameter. We know that a diameter subtends 90° on the arc.

Prove that the circle drawn with any side of a rhombus as diameter passes through

 \square \square COD = 90°

Also, in rhombus, the diagonals intersect each other at 90°.

 $\square AOB = \square BOC = \square COD = \square DOA = 90^{\circ}$

Clearly, point O has to lie on the circle.

Question 6:

ABCD is a parallelogram. The circle through A, B and C intersect CD (produced if

necessary) at E. Prove that AE = AD.

It can be observed that ABCE is a cyclic quadrilateral and in a cyclic quadrilateral, the sum of the opposite angles is 180°. \Box AEC + \Box CBA = 180°

 \Box AEC + \Box AED = 180° (Linear pair)

 $\Box AED = \Box CBA \dots (1)$

For a parallelogram, opposite angles are equal.

 $\Box ADE = \Box CBA \dots (2)$

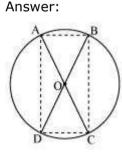

From (1) and (2),

 $\Box AED = \Box ADE$

AD = AE (Angles opposite to equal sides of a triangle)

Question 7: AC and BD are chords of a circle which bisect each other. Prove that (i) AC and BD

are diameters; (ii) ABCD is a rectangle.

Let two chords AB and CD are intersecting each other at point O.

In $\triangle AOB$ and $\triangle COD$,

OA = OC (Given)

OB = OD (Given)

90°

are

Question 8: Bisectors of angles A, B and C of a triangle ABC intersect its circumcircle at D, E and

Prove

 \square AOB = \square COD (Vertically opposite angles)

Similarly, it can be proved that $\triangle AOD \square \triangle COB$

We know that opposite angles of a parallelogram are equal.

 $\triangle AOB \square \triangle COD$ (SAS congruence rule)

AB = CD (By CPCT)

 \square AD = CB (By CPCT)

parallelogram.

□ □A = 90° As ACBD is a parallelogram and one of its interior angles is 90°, therefore, it is a

 \Box \Box A + \Box A = 180° \Box 2 \Box A = 180°

the

that

 $\square \square A = \square C$ However, $\Box A + \Box C = 180^{\circ}$ (ABCD is a cyclic quadrilateral)

Since in quadrilateral ACBD, opposite sides are equal in length, ACBD is a

rectangle. \Box A is the angle subtended by chord BD. And as \Box A = 90°, therefore, BD should be the diameter of the circle. Similarly, AC is the diameter of the circle.

angles

of

the

triangle

DEF

 $-\frac{1}{2}$ A, 90° $-\frac{1}{2}$ B and 90° $-\frac{1}{2}$ C Answer:

respectively.

It is given that BE is the bisector of \Box B.

$$\square$$
 \square ADE = 2 \angle C

Similarly, $\Box ACF = \Box ADF = \frac{2}{\sqrt{2}}$ (Angle in the same segment for chord AF) $\Box D = \Box ADE + \Box ADF$

However, $\Box ADE = \Box ABE$ (Angles in the same segment for chord AE)

$$= \frac{\angle B}{2} + \frac{\angle C}{2}$$
$$= \frac{1}{2} (\angle B + \angle C)$$

 $=\frac{1}{2}(180^{\circ}-\angle A)$

 $\angle F = 90^{\circ} - \frac{1}{2} \angle C$

□ □ABE =

 $=90^{\circ}-\frac{1}{2}\angle A$

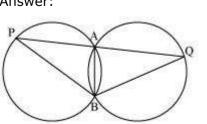

Similarly, it can be proved that

 $\angle E = 90^{\circ} - \frac{1}{2} \angle B$

Question 9:

Two congruent circles intersect each other at points A and B. Through A any line segment PAQ is drawn so that P, Q lie on the two circles. Prove that BP = BQ.

Answer:

AB is the common chord in both the congruent circles.

 \square BQ = BP (Angles opposite to equal sides of a triangle)

Let perpendicular bisector of side BC and angle bisector of $\Box A$ meet at point D. Let

 \square \square APB = \square AQB

 $\square APB = \square AQB$

Ouestion 10:

In ΔBPQ,

the perpendicular bisector of side BC intersect it at E.

Perpendicular bisector of side BC will pass through circumcentre O of the circle.

In any triangle ABC, if the angle bisector of $\Box A$ and perpendicular bisector of BC

intersect, prove that they intersect on the circum circle of the triangle ABC.

 \square BOC and \square BAC are the angles subtended by arc BC at the centre and a point A on the remaining part of the circle respectively. We also know that the angle subtended by an arc at the centre is double the angle subtended by it at any point on the

 $\square BOC = 2 \square BAC = 2 \square A \dots (1)$

remaining part of the circle.

In $\triangle BOE$ and $\triangle COE$,

OE = OE (Common)
OB = OC (Radii of same circle)

 \square OEB = \square OEC (Each 90° as OD \square BC)

 \square \triangle BOE \square \square COE (RHS congruence rule)

 \square BOE = \square COE (By CPCT) ... (2)

However, $\Box BOE + \Box COE = \Box BOC$

 \Box \Box BOE + \Box BOE = 2 \Box A [Using equations (1) and (2)]
